BRIEF FOR APPLICANTS - APPELLANTS

(i)

Real Party in Interest

The real party in interest is International Business Machines Corporation (IBM), the assignee.

(ii)

Related Appeals and Interferences

There are no other appeals or interferences known to appellants, appellants' representative or assignee, which will directly affect or be directly affected by or have a bearing on the Board's decision in the pending appeal.

(iii)

Status of Claims

Claims 1 - 37 have been finally rejected under 35 U.S.C. §103 as being unpatentable over Joyce et al. in view of Ahmed et al. in an Office Action dated August 12, 2005.

(iv)

Status of Amendment

All amendments have been entered.

(v)

Summary of Claimed Subject Matter

In accordance with the teachings of the invention, when a command is being executed on a plurality of computer systems on a network, a dialog window is displayed (page 17, lines 9 - 16 and Fig. 10). In the dialog window, sub-

AUS920010905US1

Page 2 of 17

Appl. No. 09/965,002

Response to Non-Complaint Appeal Brief dated 03/31/2006

Reply to Office Action of 03/16/2006

windows for displaying present status of the execution of the command on each of the computer systems are displayed (page 17, lines 24 to page 18, line 9).

(vi)

Grounds of Rejection to be Reviewed on Appeal

**Whether Claims 1 - 37 were properly rejected under 35 U.S.C. §103(a) as being unpatentable over Joyce et al. in view of Ahmed et al.**

(vii)

Arguments

In considering a Section §103 rejection, the subject matter of the claim "as a whole" must be considered and analyzed. In the analysis, it is necessary that the scope and contents of the prior art and differences between the art and the claimed invention be determined. *Graham v. John Deere Co.*, 383 U.S. 1 (1966).

Joyce et al. purport to teach a method of using monitoring tools to support the development of distributed systems that interact via message passing (see page 122, lines 1 - 3). In accordance with the teachings of Joyce et al., Jade, a programming environment, is used to support the development of a distributed program. Jade includes a window system, a graphics package, an interactive graphics editor and a distributed monitoring system (see Section 2 on page 125).

The graphics package provides routines for creating and manipulating pictures and the graphics editor

AUS920010905US1

Page 3 of 17

Appl. No. 09/965,002

Response to Non-Complaint Appeal Brief dated 03/31/2006

Reply to Office Action of 03/16/2006

facilitates the creation of pictures that can be used to represent specific states of an executing distributed program (see the 4<sup>th</sup> full paragraph of Section 2.1 on page 125). The window system may be used by a user to create and manipulate windows using a mouse, for example. A window is a virtual terminal as well as an interface to Jade processes (see the 3<sup>rd</sup> full paragraph of Section 2.1 on page 125).

Thus, in conjunction with the window system, the graphics package and the graphics editor, the distributed monitoring system may be used to observe a set of Jade processes executing on different machines (see the 1<sup>st</sup> full paragraph of Section 2.1 on page 125 as well as the 1<sup>st</sup> full paragraph of Section 2.2 on page 126).

The system may be set such that each time an event is received (which is generally done through message passing from one computer system to another), a picture that represents a current state of the inter-process communication of the distributed application program is updated and displayed to the user (see Section 3.2 on pages 133 and 134). Consequently, an animated graphical view of an event stream, such as that shown in Fig. 7, may be displayed to a user.

But Joyce et al. do not teach, show or suggest the step of **displaying a dialog window that is divided into sub-windows in which the status of a command that is being executed on a plurality of computer systems is displayed** as claimed.

Ahmed et al. purport to teach a distributed framework for intertask communication between workstation

AUS920010905US1

Appl. No. 09/965,002

Response to Non-Complaint Appeal Brief dated 03/31/2006

Reply to Office Action of 03/16/2006

applications. According to the purported teachings of Ahmed et al., one or more workstations are interconnected by an extensible intertask communication (ITC) apparatus. Each workstation has a display in which one or more windows are presented to an operator. Each window is generated in response to the execution of an application program or client application. Each client application has a Human Interface Code and a Framework Code. The Framework Code, in conjunction with a server program, transmits and communicates event information directly between a first client application and a second client application, or a plurality of client application programs concurrently executing in one or more workstations of a network of interconnected workstations, without requiring that event information pass through and register with an intervening server or dispatcher application program, if and when an interest object is initially transmitted between the first client application and the second client application via the server program.

An event is an action taken by one operator at a workstation. For example, that operator may drag the cursor by moving a mouse or perhaps the operator will delete data or create new data. That event information, being practiced by one operator in one program application at one workstation, may be needed by another operator in another program application at another workstation. The interprocess communication can transmit that event information from the one program application to all other program applications in the network of workstations, without requiring that the event information register with

AUS920010905US1

Appl. No. 09/965,002

Response to Non-Complaint Appeal Brief dated 03/31/2006

Reply to Office Action of 03/16/2006

an intervening server or dispatcher program, provided that an interest object(s) was initially transmitted between the one program application and all the other program applications via a server which are concurrently executing in all of the workstations in the network of workstations.

However, just as in the case of Joyce et al., Ahmed et al. do not show, teach or so much as suggest the step of **displaying a dialog window that is divided into sub-windows in which the status of a command that is being executed on a plurality of computer systems is displayed** as claimed.

Since the references, neither alone nor in combination, teach, show or suggest the claimed invention, Applicants submit that the claims in the Application are allowable. Hence, Applicants respectfully request allowance and passage to issue of the claims in the application.

Respectfully Submitted

Claims Appendix

1. (Previously presented) A method of displaying an execution status of a command, said command being sent to a plurality of computer systems on a network for execution, said method comprising the steps of:

displaying a dialog window, said dialog window being divided into sub-windows for displaying present status of the execution of the command on each of the computer systems; and

displaying the status of the execution of the command on each of the computer systems within a proper sub-window.

2. (Original) The method of Claim 1 wherein said sub-windows include a "waiting" sub-window, a "working" sub-window and a "completed" sub-window.
3. (Original) The method of Claim 2 wherein the step of displaying the status of the execution of the command includes displaying the names of the computer systems in the sub-windows in accordance with the status of the execution of the command on the computer systems.
4. (Original) The method of Claim 3 wherein when the command begins to execute on a computer system, the

Response to Non-Complaint Appeal Brief dated 03/31/2006

Reply to Office Action of 03/16/2006

name of the computer system is moved from the "waiting" sub-window to the "working" sub-window.

5. (Original) The method of Claim 4 wherein when the command has finished executing on a computer, the name of the computer is moved from the "working" sub-window to the "completed" sub-window.
6. (Original) The method of Claim 5 wherein the "completed" sub-window is further divided into a "successful" sub-window and a "failed" sub-window.
7. (Original) The method of Claim 6 wherein the names of the computer systems that have successfully completed the execution of the command are displayed in the "successful" sub-window.
8. (Previously presented) The method of Claim 7 wherein the names of the computer systems that have not successfully completed the execution of the command are displayed in the "failed" sub-window.
9. (Previously presented) The method of Claim 8 wherein the names of the computer systems that have not successfully completed the execution of the command are displayed in red in the "failed" sub-window.
10. (Original) The method of Claim 9 wherein when the displayed name of a computer system is selected

Further information about the status of the command executing on the computer system is displayed.

11. (Original) The method of Claim 10 wherein if the selected computer system is displayed in the failed sub-window, a reason for the unsuccessful completion of the execution of the command is displayed.

12. (Previously presented) The method of Claim 11 wherein if the selected computer system is displayed in the executing sub-window, a real-time progress of the execution of the command is displayed.

13. (Previously presented) A computer program product on a computer readable medium for displaying an execution status of a command, said command being sent to a plurality of computer systems on a network for execution, said computer program product comprising:

code for displaying a dialog window, said dialog window being divided into sub-windows for displaying present status of the execution of the command on each of the computer systems; and

code for displaying the status of the execution of the command on each of the computer systems within the proper sub-window.

14. (Original) The computer program product of Claim 13 wherein said sub-windows include a "waiting" sub-

window, a "working" sub-window and a "completed" sub-window.

15. (Original) The computer program product of Claim 14 wherein the code for displaying the status of the execution of the command includes code for displaying the names of the computer systems in the sub-windows in accordance with the status of the execution of the command on the computer systems.
16. (Original) The computer program product of Claim 15 wherein when the command begins to execute on a computer system, the name of the computer system is moved from the "waiting" sub-window to the "working" sub-window.
17. (Original) The computer program product of Claim 16 wherein when the command has finished executing on a computer, the name of the computer is moved from the "working" sub-window to the "completed" sub-window.
18. (Original) The computer program product of Claim 17 wherein the "completed" sub-window is further divided into a "successful" sub-window and a "failed" sub-window.
19. (Original) The computer program product of Claim 18 wherein the names of the computer systems that have successfully completed the execution of the command are displayed in the "successful" sub-window.

windows for displaying present status of the execution of the command on each of the computer systems are displayed (page 17, lines 24 to page 18, line 9).

(vi)

Grounds of Rejection to be Reviewed on Appeal

**Whether Claims 1 - 37 were properly rejected under 35 U.S.C. §103(a) as being unpatentable over Joyce et al. in view of Ahmed et al.**

(vii)

Arguments

In considering a Section §103 rejection, the subject matter of the claim "as a whole" must be considered and analyzed. In the analysis, it is necessary that the scope and contents of the prior art and differences between the art and the claimed invention be determined. *Graham v. John Deere Co.*, 383 U.S. 1 (1966).

Joyce et al. purport to teach a method of using monitoring tools to support the development of distributed systems that interact via message passing (see page 122, lines 1 - 3). In accordance with the teachings of Joyce et al., Jade, a programming environment, is used to support the development of a distributed program. Jade includes a window system, a graphics package, an interactive graphics editor and a distributed monitoring system (see Section 2 on page 125).

The graphics package provides routines for creating and manipulating pictures and the graphics editor

AUS920010905US1

applications. According to the purported teachings of Ahmed et al., one or more workstations are interconnected by an extensible Intertask communication (ITC) apparatus. Each workstation has a display in which one or more windows are presented to an operator. Each window is generated in response to the execution of an application program or client application. Each client application has a Human Interface Code and a Framework Code. The Framework Code, in conjunction with a server program, transmits and communicates event information directly between a first client application and a second client application, or a plurality of client application programs concurrently executing in one or more workstations of a network of interconnected workstations, without requiring that event information pass through and register with an intervening server or dispatcher application program, if and when an interest object is initially transmitted between the first client application and the second client application via the server program.

An event is an action taken by one operator at a workstation. For example, that operator may drag the cursor by moving a mouse or perhaps the operator will delete data or create new data. That event information, being practiced by one operator in one program application at one workstation, may be needed by another operator in another program application at another workstation. The interprocess communication can transmit that event information from the one program application to all other program applications in the network of workstations, without requiring that the event information register with

an intervening server or dispatcher program, provided that an interest object(s) was initially transmitted between the one program application and all the other program applications via a server which are concurrently executing in all of the workstations in the network of workstations.

However, just as in the case of Joyce et al., Ahmed et al. do not show, teach or so much as suggest the step of **displaying a dialog window that is divided into sub-windows in which the status of a command that is being executed on a plurality of computer systems is displayed** as claimed.

Since the references, neither alone nor in combination, teach, show or suggest the claimed invention, Applicants submit that the claims in the Application are allowable. Hence, Applicants respectfully request allowance and passage to issue of the claims in the application.

Claims Appendix

1. (Previously presented) A method of displaying an execution status of a command, said command being sent to a plurality of computer systems on a network for execution, said method comprising the steps of:

displaying a dialog window, said dialog window being divided into sub-windows for displaying present status of the execution of the command on each of the computer systems; and

displaying the status of the execution of the command on each of the computer systems within a proper sub-window.

2. (Original) The method of Claim 1 wherein said sub-windows include a "waiting" sub-window, a "working" sub-window and a "completed" sub-window.
3. (Original) The method of Claim 2 wherein the step of displaying the status of the execution of the command includes displaying the names of the computer systems in the sub-windows in accordance with the status of the execution of the command on the computer systems.
4. (Original) The method of Claim 3 wherein when the command begins to execute on a computer system, the

name of the computer system is moved from the "waiting" sub-window to the "working" sub-window.

5. (Original) The method of Claim 4 wherein when the command has finished executing on a computer, the name of the computer is moved from the "working" sub-window to the "completed" sub-window.

6. (Original) The method of Claim 5 wherein the "completed" sub-window is further divided into a "successful" sub-window and a "failed" sub-window.

7. (Original) The method of Claim 6 wherein the names of the computer systems that have successfully completed the execution of the command are displayed in the "successful" sub-window.

8. (Previously presented) The method of Claim 7 wherein the names of the computer systems that have not successfully completed the execution of the command are displayed in the "failed" sub-window.

9. (Previously presented) The method of Claim 8 wherein the names of the computer systems that have not successfully completed the execution of the command are displayed in red in the "failed" sub-window.

10. (Original) The method of Claim 9 wherein when the displayed name of a computer system is selected

Further information about the status of the command executing on the computer system is displayed.

11. (Original) The method of Claim 10 wherein if the selected computer system is displayed in the failed sub-window, a reason for the unsuccessful completion of the execution of the command is displayed.

12. (Previously presented) The method of Claim 11 wherein if the selected computer system is displayed in the executing sub-window, a real-time progress of the execution of the command is displayed.

13. (Previously presented) A computer program product on a computer readable medium for displaying an execution status of a command, said command being sent to a plurality of computer systems on a network for execution, said computer program product comprising:

code for displaying a dialog window, said dialog window being divided into sub-windows for displaying present status of the execution of the command on each of the computer systems; and

code for displaying the status of the execution of the command on each of the computer systems within the proper sub-window.

BRIEF FOR APPLICANTS - APPELLANTS

(I)

Real Party in Interest

The real party in interest is International Business Machines Corporation (IBM), the assignee.

(II)

Related Appeals and Interferences

There are no other appeals or interferences known to appellants, appellants' representative or assignee, which will directly affect or be directly affected by or have a bearing on the Board's decision in the pending appeal.

(III)

Status of Claims

Claims 1 - 37 have been finally rejected under 35 U.S.C. §103 as being unpatentable over Joyce et al. in view of Ahmed et al. in an Office Action dated August 12, 2005.

(IV)

Status of Amendment

All amendments have been entered.

(V)

Summary of Claimed Subject Matter

In accordance with the teachings of the invention, when a command is being executed on a plurality of computer systems on a network, a dialog window is displayed (page 17, lines 9 - 16 and Fig. 10). In the dialog window, sub-

AUS920010905US1

Page 2 of 17

Appl. No. 09/965,002

Response to Non-Complaint Appeal Brief dated 03/31/2006

Reply to Office Action of 03/16/2006

windows for displaying present status of the execution of the command on each of the computer systems are displayed (page 17, lines 24 to page 18, line 9).

(vi)

Grounds of Rejection to be Reviewed on Appeal

**Whether Claims 1 - 37 were properly rejected under 35 U.S.C. §103(a) as being unpatentable over Joyce et al. in view of Ahmed et al.**

(vii)

Arguments

In considering a Section §103 rejection, the subject matter of the claim "as a whole" must be considered and analyzed. In the analysis, it is necessary that the scope and contents of the prior art and differences between the art and the claimed invention be determined. *Graham v. John Deere Co.*, 383 U.S. 1 (1966).

Joyce et al. purport to teach a method of using monitoring tools to support the development of distributed systems that interact via message passing (see page 122, lines 1 - 3). In accordance with the teachings of Joyce et al., Jade, a programming environment, is used to support the development of a distributed program. Jade includes a window system, a graphics package, an interactive graphics editor and a distributed monitoring system (see Section 2 on page 125).

The graphics package provides routines for creating and manipulating pictures and the graphics editor

AUS920010905US1

Page 3 of 17

Appl. No. 09/965,002

Response to Non-Complaint Appeal Brief dated 03/31/2006

Reply to Office Action of 03/16/2006

facilitates the creation of pictures that can be used to represent specific states of an executing distributed program (see the 4<sup>th</sup> full paragraph of Section 2.1 on page 125). The window system may be used by a user to create and manipulate windows using a mouse, for example. A window is a virtual terminal as well as an interface to Jade processes (see the 3<sup>rd</sup> full paragraph of Section 2.1 on page 125).

Thus, in conjunction with the window system, the graphics package and the graphics editor, the distributed monitoring system may be used to observe a set of Jade processes executing on different machines (see the 1<sup>st</sup> full paragraph of Section 2.1 on page 125 as well as the 1<sup>st</sup> full paragraph of Section 2.2 on page 126).

The system may be set such that each time an event is received (which is generally done through message passing from one computer system to another), a picture that represents a current state of the inter-process communication of the distributed application program is updated and displayed to the user (see Section 3.2 on pages 133 and 134). Consequently, an animated graphical view of an event stream, such as that shown in Fig. 7, may be displayed to a user.

But Joyce et al. do not teach, show or suggest the step of **displaying a dialog window that is divided into sub-windows in which the status of a command that is being executed on a plurality of computer systems is displayed** as claimed.

Ahmed et al. purport to teach a distributed framework for intertask communication between workstation

AUS920010905US1

Appl. No. 09/965,002

Response to Non-Complaint Appeal Brief dated 03/31/2006

Reply to Office Action of 03/16/2006

applications. According to the purported teachings of Ahmed et al., one or more workstations are interconnected by an extensible intertask communication (ITC) apparatus. Each workstation has a display in which one or more windows are presented to an operator. Each window is generated in response to the execution of an application program or client application. Each client application has a Human Interface Code and a Framework Code. The Framework Code, in conjunction with a server program, transmits and communicates event information directly between a first client application and a second client application, or a plurality of client application programs concurrently executing in one or more workstations of a network of interconnected workstations, without requiring that event information pass through and register with an intervening server or dispatcher application program, if and when an interest object is initially transmitted between the first client application and the second client application via the server program.

An event is an action taken by one operator at a workstation. For example, that operator may drag the cursor by moving a mouse or perhaps the operator will delete data or create new data. That event information, being produced by one operator in one program application at one workstation, may be needed by another operator in another program application at another workstation. The interprocess communication can transmit that event information from the one program application to all other program applications in the network of workstations, without requiring that the event information register with

Appl. No. 09/965,002

Response to Non-Complaint Appeal Brief dated 03/31/2006

Reply to Office Action of 03/16/2006

an intervening server or dispatcher program, provided that an interest object(s) was initially transmitted between the one program application and all the other program applications via a server which are concurrently executing in all of the workstations in the network of workstations.

However, just as in the case of Joyce et al., Ahmed et al. do not show, teach or so much as suggest the step of **displaying a dialog window that is divided into sub-windows in which the status of a command that is being executed on a plurality of computer systems is displayed** as claimed.

Since the references, neither alone nor in combination, teach, show or suggest the claimed invention, Applicants submit that the claims in the Application are allowable. Hence, Applicants respectfully request allowance and passage to issue of the claims in the application.

36. (Previously presented) The apparatus of Claim 35 wherein if the selected computer system is displayed in the executing sub-window, a real-time progress of the execution of the command is displayed.

37. (Previously presented) A method of displaying an execution status of a command, the command being executed by a plurality of computer systems on a network, the computer systems running different system management software utilities having different command structures, the method comprising the steps of:

enabling a user to enter the command in a common interface, the command being either a request to start execution of another command or to stop execution of the other command, the common interface translating the command into the different command structures;

enabling a user to send the command to the plurality of the computer systems;

enabling a user to indicate whether or not the execution of the command is to be monitored;
